DESIGN

Redstring AI

Designing an agentic hiring system that helps startups and institutions find high-fit talent without friction

Hiring is not just about filling roles. It's about trust, timing, and finding people who can grow with uncertainty.

But for most startups and SMEs, hiring today feels fragmented, expensive, and rushed. Resumes pile up. Decisions get delayed. Cultural misfits slip through.

During my time at Redstring AI, I worked on reimagining hiring as an end-to-end, intelligent experience—one that removes operational burden while preserving human judgment.

The Problem I Wanted to Solve

Startups and small to medium-sized enterprises struggle to hire trustworthy, high-fit talent quickly and cost-effectively.

Most teams face three recurring challenges.

First, overwhelming applications. Roles attract hundreds of resumes, but early-stage teams lack the time and structure to review them meaningfully. Important signals get buried under noise.

Second, urgency with budget constraints. Hiring needs to happen fast, but without large recruiting teams, expensive tools, or long feedback loops.

Third, cultural alignment. Early-stage companies need ownership-driven, adaptable people. Traditional resume screening fails to capture mindset, motivation, or behavioral fit—leading to costly mis-hires.

The Idea Behind Redstring

Redstring was built as a Virtual Recruiter powered by agentic AI. Not a tool that assists hiring—but a system that runs it.

The goal was to automate everything that slows teams down, while surfacing insights that actually matter for decision-making.

From candidate sourcing and evaluation to interview scheduling and offer generation, Redstring orchestrates the entire hiring lifecycle in one continuous flow.

What Makes Redstring Different

Agentic Hiring Flow

Instead of isolated automations, Redstring manages hiring as a connected journey—from first signal to final offer.

Domain-Specific Assessments

Candidates are evaluated using role-relevant skill tests, behavioral indicators, and contextual data—not just resumes.

Cultural & Behavioral Signals

The system surfaces indicators aligned with early-stage environments: ownership, adaptability, and execution mindset.

Automated Scheduling & Offers

Interview coordination and offer letters are generated automatically, reducing time-to-hire without reducing quality.

My Design Challenge

My responsibility was translating this complex AI-driven system into clear, usable, and trustworthy experiences. I worked across: Information architecture Low-fidelity wireframes High-fidelity, production-ready screens The hardest part wasn't visual design—it was cognitive clarity.

Recruiters needed to understand: What the AI was doing Why certain candidates were shortlisted When and how to intervene Without feeling replaced or overwhelmed.

Key Design Decisions

Progressive Disclosure

AI insights were revealed only when relevant. This kept screens focused and reduced decision fatigue.

Separation of Signals and Decisions

Skill scores, behavioral indicators, and cultural signals were visually separated from final recommendations, allowing recruiters to audit—not blindly trust—the system.

Consistency Across Dashboards

Shared patterns, modular components, and predictable navigation ensured speed and scalability across flows.

Identifying a White-Label Opportunity

During my internship, I identified a major gap in campus placement and institutional hiring infrastructure.

Most placement cells relied on fragmented portals and outdated CRMs that:
Failed to showcase student talent effectively
Offered poor recruiter experiences
Couldn't scale across campus drives

To address this, I designed and positioned a white-labeled SaaS product line under Redstring AI, tailored specifically for institutions and EdTech cohorts.

White-Labeled SaaS Model

The system was designed to power:
5,000+ student profiles
Placement portals
100+ campus drives

All under institution-branded deployments.

This allowed colleges and EdTech programs to present modern, credible talent platforms—while leveraging Redstring's AI infrastructure behind the scenes.

Recruiter Experience

The recruiter side was designed for clarity, speed, and scale.

Recruiter Dashboards

A real-time overview of active roles, pipeline health, and AI insights.

Candidate Search Boards

Advanced filtering across skills, behavior, and contextual signals.

Email Automation Dashboards

Integrated outreach, follow-ups, and interview coordination without leaving the platform.

The overall recruiter flow guided users from role creation to offer rollout with minimal manual handoffs.

Conversation & Interview Layer

A unified conversation screen brought together:
Candidate communication
Interview scheduling
Feedback and system prompts
This reduced context switching and preserved continuity across the hiring journey.

What I Learned

Hiring systems must balance automation with human trust AI should explain itself —not just act Recruiters value clarity more than control Scalable systems depend on strong information architecture

Redstring AI reinforced my belief that good UX isn't about making systems look simple—it's about making complexity feel manageable.

This project wasn't just about hiring faster. It was about hiring better—with intention, structure, and respect for both sides of the process.
