

Rengenx

RegenX – UX Case Study

***Reviving Startup Dreams. Reducing Digital Waste.
Reimagining Investment.***

Project Overview

RegenX is a community-driven investment platform that helps revive abandoned startup projects by connecting them to investors through a live bidding model. **Think: Shark Tank meets Product Hunt** — designed for founders who deserve a second chance and investors looking to discover underdog potential before it's mainstream.

The problem

Hackathons create brilliance — but brilliance often dies in silence.

We found that most hackathon projects or early MVPs vanish due to one core gap: **lack of timely capital and visibility**. These half-built startups remain in Google Drives, GitHub repos, and cloud servers — **consuming energy, storage, and mental space** — but never reaching users.

It's not just a loss of innovation. It's a contributor to the **digital carbon footprint** — where energy is spent storing work that never gets activated.

My Challenge

How might we design a product that:

- Helps early-stage ideas stay alive and get seen
- Allows investors to discover and bid live on real talent
- Creates a space for trust, growth, and post-deal accountability
- Reduces digital waste by regenerating rather than replacing

User Research

Who I Spoke To:

- **10** startup founders (most had dead MVPs)
- **6** angel investors
- **3** startup mentors from incubators

What I Learned:

- Founders want faster visibility and less gatekeeping
- Investors are tired of pitch spam with no traction
- Everyone agrees: early-stage doesn't mean early-trash

One founder said:

“We had the deck, the code, and even some users. We just didn't have someone to believe in it.”

Key Goals

1. Build an engaging bidding interface that feels real-time and intuitive
2. Let founders and investors chat securely and share validation
3. Show demand data and traction visually
4. Post-deal, allow both sides to track outcomes transparently

User Research

Who I Spoke To:

- **10** startup founders (most had dead MVPs)
- **6** angel investors
- **3** startup mentors from incubators

What I Learned:

- Founders want faster visibility and less gatekeeping
- Investors are tired of pitch spam with no traction
- Everyone agrees: early-stage doesn't mean early-trash

One founder said:

“We had the deck, the code, and even some users. We just didn't have someone to believe in it.”

The Solution: RegenX

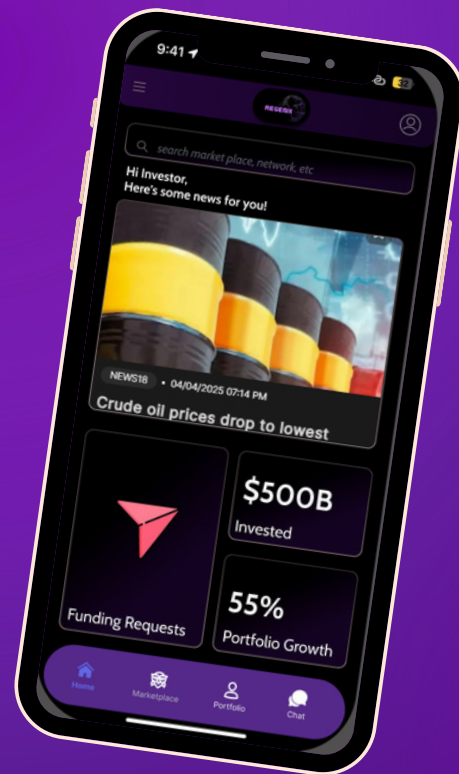

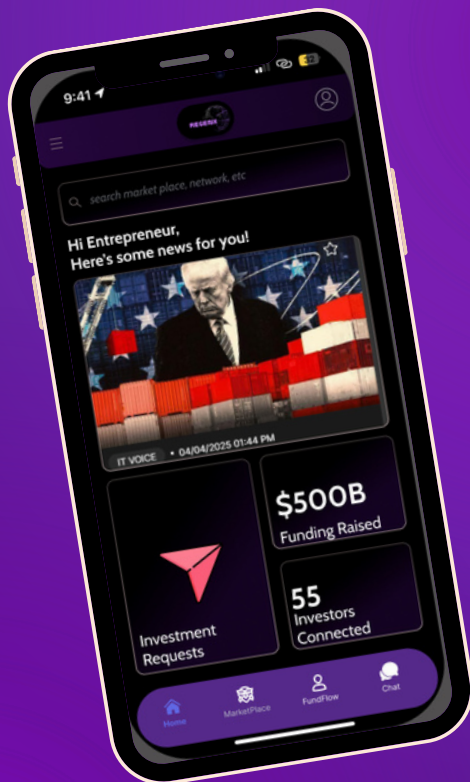

A platform that revives dormant startups, connects them with live investors, and tracks outcomes after funding — all in one product.

Core Features

Homepage(for investors and founders)

A role-based interface that surfaces:

- Live bidding opportunities
- Trending sectors
- Access to chats, deal rooms, and personal funding stats
- It gives founders quick access to their funding progress and investors a clean portfolio view.

Marketplace (Bidding Page)

This is where the energy lives.

Startups are shown as cards with live traction graphs, funding goals, and time-based bid countdowns.

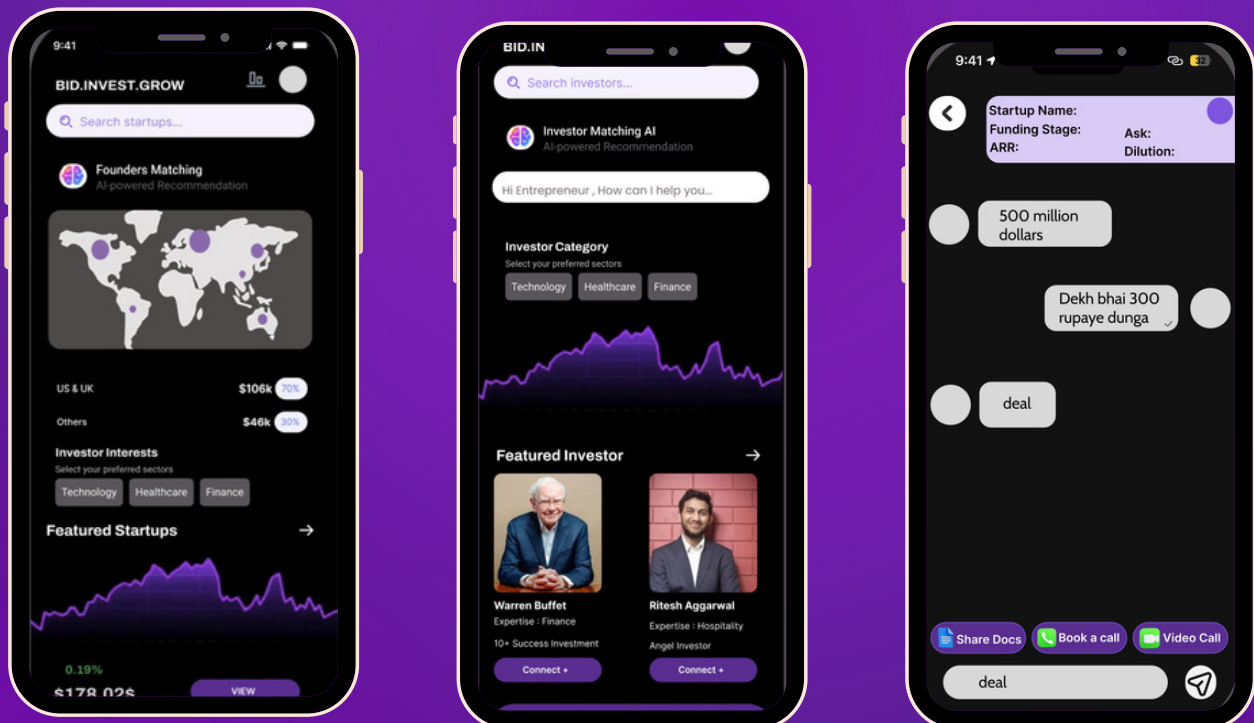

Investors can filter startups by domain or demand, and either “**Watch**” or “**Bid**” instantly.

Every bid updates in real-time, creating a sense of momentum and competition.

Chat interface

A built-in chat system connects founders and investors securely.

It supports file sharing (pitch decks, MVP demos, financial proofs), voice notes, and Visual trust signals (like verified badges, timestamps, and read indicators) ensure clarity and transparency.

Post deal tracking dashboard

Once a deal is done, both parties get access to a mutual dashboard.

- Founders can track funds raised, funds spent, and key milestones
- Investors see growth updates, performance metrics, and reinvest options

Design Decisions

- Dark theme reflects the serious nature of funding
- Purple accent adds innovation energy without feeling childish
- Graphs and heat tags create urgency and help users prioritize

What I Learned

- UX is about more than just solving a problem — it's about keeping hope alive
- Founders need empathy, not just interfaces
- Investors value clarity over complexity
- Sustainability in tech starts with designing platforms that don't throw innovation away

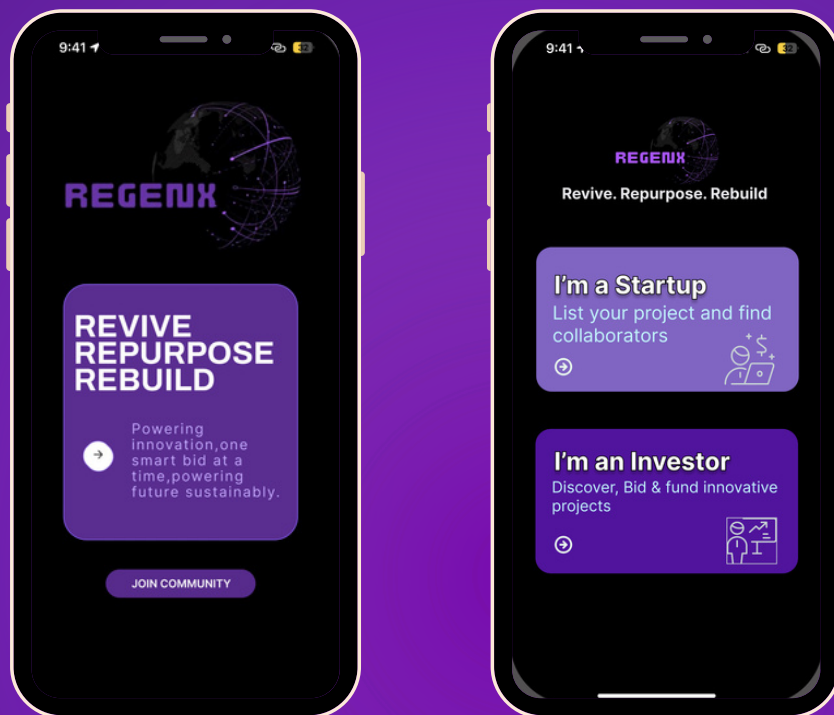

Biggest Win (and Lesson)

I pitched this. It didn't go perfectly.

But that's what made it my favorite project.

Someone didn't get the idea of digital waste.

But others did. And that taught me how important it is to defend design with logic, not just slides.

If I had 5 seconds to explain RegenX:

“A platform that revives dead startups through live bidding, builds trust between founders and investors, and reduces waste by making innovation stick.”
